

Freezer Nanny provides freezer monitoring hardware and software for freezers at CLASS Biorepository. This product monitors inside freezer temperature, door openings and power outages. In the case of set alarm points are reached, the software calls, texts and emails alarms. Freezer Nanny allows users to log in to account to monitor freezers from any browser or mobile device. Our freezers contain samples from PIs across the University of Michigan campus and research institutes world-wide. We were seeking to upgrade and increase our freezer monitoring capability. This company provides a product that is well suited to our needs at a cost significantly less than available from an alternate supplier. The principal, Manhong Dai, is extremely easy and pleasant to work with, prompt and professional. We purchased our first batch of monitors and have been satisfied with the performance such that we will soon purchase additional units.
